

Level: PhD				
Course title: Selected Topics of Medicinal Chemistry (DSB602)				
Status: elective				
ECTS: 15				
Requirements: None				
Learning objectives Introduction to advanced chemical, biochemical and biomedical methods for the development, processing and <i>in vitro</i> testing of new pharmacologically active molecules as potential drugs.				
Learning outcomes Students will introduced to modern methods of drug design and production, and will become able to understand the mechanism of their action on the molecular level. The basic practical skills on experimental techniques for testing of antitumour activity <i>in vitro</i> will also be acquired.				
Syllabus <i>Theoretical instruction</i> Current strategies for the development of new pharmacologically active molecules. Development of enzyme inhibitors as drugs: rational selection of suitable target enzyme and inhibitor; selectivity and toxicity; rational design of enzyme inhibitors (including computer-aided methods); development of a drug candidate from the bench to the marketplace. Enzyme inhibitor examples for the treatment of breast and prostate cancer. HIV-1 protease drug development examples. Analogues, derivatives and mimetic of monosaccharides as potential drugs. <i>Practical instruction</i> Current biological methods for evaluation of antitumor activity <i>in vitro</i> . Molecular docking.				
Weekly teaching load				Other:
Lectures: 5	Exercises:	Other forms of teaching:	Student research: 5
