Study Programme: Applied	Mathematics	– Data	Science
--------------------------	-------------	--------	---------

Course title: High Performance Computing

Professor: Srdjan Skrbic

Course status: elective

Number of ECTS: 5

Prerequisites: None

Course objective: High performance computing is seen as the only cost-effective method for fast solution of computationally large and data-intensive problems. That is why the objective of this course is to study the principles, tools, and techniques for programming the wide variety of parallel and high performance platforms currently available.

Course outcome:

Minimal: At the end of the course, it is expected that students understand and show ability to discuss advantages and disadvantages of different high performance architectures and paradigms. The knowledge of parallel programming using the message passing paradigm is a must for every student.

Desirable: At the end of the course, it is expected that a successful student understand solutions to key problems in high performance computing and shows ability to identify the optimal way of solving particular given problem. From a successful student is also expected to have active knowledge of advanced concepts of parallel programming using the message passing paradigm.

Course content

Theoretical part

At the beginning of the course, introduction to high performance computing including motivation and fields of application is explained. After that, parallel architectures and platforms are examined. In the third part of the course, principles of design of parallel algorithms, decomposition techniques and models of parallel algorithms are studied. The final part of the course is dedicated to details related to parallel programming using the message passing paradigm.

Practical part

In the first part of the practical classes, ways to connect computers to a computer cluster or a grid are examined and practically demonstrated. The rest of the practical instruction is spent on mastering practical skills of parallel programming using message passing paradigm through analysis of a number of examples and case studies.

Methods of instruction:

During theoretical classes, classical methods of teaching with the use of a projector are used to present stated topics. On practical classes, classical methods of teaching with the use of a projector and computers with appropriate software installed are used to practically master the skills of usage of suggested tools. A premise for successful practical classes is the existence of enough computers so that every student may work individually.

Assessment (maximum number of points 100)					
Requirements	Points	Final exam	Points		
two sequential assessments	25, 25	oral exam	50
