Level: bachelor

Course title: HPLC in Biochemistry (IB-405)

Status: elective

ECTS: 6

Requirements: none

Learning objectives

To provide students with systematic knowledge in high-performance liquid chromatography, with focus on application in biochemistry and related fields. To provide students with practical skills in development and application of HPLC methods in solving biochemical and related problems.

Learning outcomes

After completing the course, student is able to: (1) describe the fields of use of liquid chromatography in modern biochemical, medicinal and related investigations, (2) demonstrate knowledge of HPLC hardware and parameters, and their effects on analysis results, (3) independently select, adapt and develop new chromatographic methods for solving biochemical and related problems, (4) perform HPLC and MS-specific laboratory procedures and techniques, (5) perform data analysis and critically evaluate results of HPLC-DAD and HPLC-MS analysis.

Syllabus

Theoretical instruction

Basic concepts in chromatography, and performance parameters. Retention mechanisms in HPLC, HPLC modes, optimization of chromatographic separation. HPLC hardware (pumps, injectors, columns, detectors) – principles, limitations, effects of settings on analysis results. Qualitative HPLC analysis – identification by retention, basics of UV/VIS, API-MS and NMR spectrometry. Quantitative LC analysis – data processing, optimization of quantitative HPLC-UV/VIS, HPLC-MS and HPLC-FLD methods, validation. Basics of preparative HPLC. Sample preparation for HPLC analysis. HPLC analysis of primary and secondary biomolecules (amino acids, peptides and proteins, carbohydrates, lipids, vitamins, nucleic acids and their monomers, plant phenols, terpenoids and alcaloids) – sample preparation, chromatography, detection, spectral characteristics, identification. Application of HPLC in biochemistry and related fields – pharmaceuticals, food, forensics, clinical diagnostics, biochemical investigations.

Practical instruction

Familiarization with HPLC-DAD instrument and software. Preparation and qualitative HPLC-DAD analysis of selected plant material. Development of quantitative HPLC-DAD method for selected natural products. Software for HPLC separation optimization. Familiarization with HPLC-MS-MS instrument and software. Demonstration of MSⁿ techniques, interpretation of ESI-MS spectra. Development of quantitative HPLC-MS/MS method for selected natural products. Interpretation of ESI-MS spectra of proteins (molecular weight determination), peptides (*de novo* sequencing) and triacylglycerols (structure elucidation).
