

Study Programme: Physics
Course Unit Title: Physics of Functional Materials
Course Unit Code: FD18FFM
Name of Lecturer(s): dr Svetlana Lukić-Petrović
Type and Level of Studies: PhD Physical Sciences
Course Status (compulsory/elective): elective
Semester (winter/summer): winter
Language of instruction: English
Mode of course unit delivery (face-to-face/distance learning): face-to-face
Number of ECTS Allocated: 30
Prerequisites:
Course Aims: Getting contemporary knowledge about the models and physical properties of matter in condensed state and the application of functional materials.
Learning Outcomes: Possibility of a scientifically based understanding of physical processes and the interpretation of physical phenomena of functional materials. <ul style="list-style-type: none"> - Ability to follow professional literature and to prepare scientific reports - The ability to participate in teaching as a demonstrator in this field.
Syllabus: <p><i>Theory</i></p> <p>The influence of structural ordering on material properties. Phenomenological physical processes in materials with ordered and disordered internal structure. Interdependence in the triad of "synthesis-structure-properties" for functional materials. Physics of materials for electronics and optoelectronics. Metals and alloys. Amorphous metals. Amorphous and nanostructured chalcogenide semiconductors and glass-ceramics. Materials for optical applications. Luminescent materials. Heat conductors and insulators. Special ceramic materials. Thermoelectric materials. Polymeric materials. Crystalline and amorphous polymers. Materials for solar panels. Metal and non-metallic materials modified with electroconductive polymers for use in new technologies. Quasicrystals. The concept of non-crystalline symmetry, quasi-periodic cells, thin layers of quasicrystals. Superconducting compounds and alloys. Exotic superconductors. Contemporary magnetically soft and magnetically hard materials. Carbon-based materials: diamond, graphite, fuleren, carbon nanotubes and wires. Nanostructured photocatalysts. Materials of reduced dimensions for efficient light absorption and energy conversion. Thin layers of crystalline and non-crystalline internal structure. Microstructural characteristics, defects and impurities. Models of growth and formation of thin layers. Optical properties of thin films</p> <p><i>Practice</i></p> <p>Preparation and public defense of seminar works that follow and supplement the lecture program.</p>
Required Reading: <ol style="list-style-type: none"> 1. D.M. Petrovic, S.R. Lukic, <i>Eksperimentalna fizika kondenzovane materije</i>, Edicija "Univerzitetski udžbenik", Univerzitet u Novom Sadu, Novi Sad, 2000. 2. Steven H. Simon, <i>The Oxford Solid State Basics</i>, Oxford University Press, Oxford, 2013.. 3. S.R. Elliott, <i>Physics of Amorphous Materials</i>, Wiley, New York, 1989. 4. M. Popescu, <i>Non-Crystalline Chalcogenides</i>, KLUWER ACADEMIC PUBLISHERS, New York, 2008. 5. Stephen Blundell, <i>Magnetism in Condensed Matter</i>, University Press, Oxford, 2004.

Weekly Contact Hours:	Lectures:5	Practical work:15
------------------------------	-------------------	--------------------------

Teaching Methods:

Knowledge Assessment (maximum of 100 points):

Pre-exam obligations	points	Final exam	points
Active class participation		written exam	
Practical work		oral exam	70
Preliminary exam(s)		
Seminar(s)	30		

The methods of knowledge assessment may differ; the table presents only some of the options: written exam, oral exam, project presentation, seminars, etc.
