

<b>Level:</b> bachelor			
<b>Course title:</b> Selected chapters in mechanics and electrodynamics			
<b>Status:</b> elective			
<b>ECTS:</b> 6			
<b>Requirements:</b> Introduction to theoretical physics			
<b>Learning objectives</b> Deepening knowledge in certain areas of classical mechanics and electrodynamics.			
<b>Learning outcomes</b> After taking the course, students should have developed: <b>General abilities:</b> basic knowledge of this field, following the literature, analysis of various solutions and the choice of the most adequate solution, application in practice and other subjects. <b>Subject-specific capabilities:</b> <ul style="list-style-type: none"> <li>- posing variational problems</li> <li>- using the Noether's theorem</li> <li>- canonical formalism and Hamilton- Jacobi method</li> <li>- solving the equation of electromagnetic potentials</li> <li>- knowing the covariant formulation of electrodynamics</li> <li>- deriving the equations from the variational principles in electrodynamics</li> </ul>			
<b>Syllabus</b> <i>Theoretical instruction</i> Variational methods: synchronous variations and unconstrained and constrained variational problems; asynchronous variations and conservation laws through Noether's theorem. Canonical transformations and Hamilton-Jacobi method. Green's functions for Poisson's equation and wave equation of electromagnetic potentials. Retarded potentials, Liénard-Wiechert potentials, and Larmor formula. Covariant formulation of electrodynamics. Variational problems in electrodynamics. <i>Practical instruction</i> Problem solving sessions			
<b>Weekly teaching load</b>			<b>Other:</b>
<b>Lectures:</b> 3	<b>Exercises:</b> 1	<b>Other forms of teaching:</b> 1
